

Rad: TÅ 23

Tillstånd: Ofullständigt rotfyllt tand utan apikal parodontit med exponerat rotkanalssystem när protetisk behandling planeras.

Åtgärd: Revisionsbehandling följt av protetisk behandling med (intraradikulärt) stift.

Beskrivning av tillstånd och åtgärd

En person med en rotfyllt tand utan apikal förändring där protetisk behandling med intraradikulärt stift planeras. Röntgenundersökning visar inga tecken på periapikal parodontit men att rotfyllningen är ofullständig (otät, för tunn, för kort eller saknas). Åtgärden är revision, det vill säga att göra om den befintliga rotfyllningen, innan preparation och cementering av ett intraradikulärt stift.

Vilken effekt har åtgärden?

Det saknas studier för att kunna bedöma effekterna av revision av en ofullständigt rotfyllt tand utan periapikal parodontit jämfört med ingen revision, avseende apikala förhållanden och tandöverlevnad efter protetisk behandling med intraradikulärt stift.

Har åtgärden några biverkningar eller oönskade effekter?

- Åtgärden innehåller inga kända biverkningar eller oönskade effekter.
- Det saknas information i studierna om biverkningar eller oönskade effekter.
- Ja. Vid en revision kan oönskade effekter uppstå som perforation av roten eller smärta på grund av infektion.

Vilka studier ingår i granskningen?

I underlaget ingår 0 studier.

Populationen i sökta studier var patienter där en tand med en ofullständig rotfyllning och utan tecken på periapikal parodontit ska förses med fast protetik med ett intraradikulärt stift. I interventionsgruppen skulle revision av rotfyllning ha utförts före protetisk behandling medan kontrollgruppen skulle få protetisk behandling utan revision. De sökta utfallsmåtten var apikala förhållanden efter minst 6 månader och tandöverlevnad efter 5 år.

Under granskning av litteraturen identifierades 3 tvärsnittsstudier som med röntgenbilder undersöker sambandet mellan periapikalstatus och rotfyllningens kvalitet hos tänder med ett intraradikulärt stift [1-3]. De tre studierna redovisar en högre andel periapikal parodontit på tänder med intraradikulära stift och dålig kvalitet på rotfyllningen jämfört med tänder med intraradikulära stift där rotfyllningen är av god kvalitet. I en retrospektiv tvärsnittsstudie är det emellertid inte möjligt att avgöra om en periapikal parodontit utvecklats före eller efter att det

intraradikulära stiftet placerats. I studierna redovisas heller inte hur lång tid som gått sedan rotfyllningar och stift gjordes. Eftersom studietypen inte är lämplig för orsakssamband så ingår de inte i det aktuella underlaget.

- Inga pågående studier har identifierats.
- Ja.

Saknas någon information i studierna?

- Ingen relevant information saknas i studierna utifrån de uppställda inklusionskriterierna.
- Ja. Det saknas studier.

Översikt av granskade studier
